

H 1012 – Rwaished area

Well H 1012 “RWAISHED NO 2” is located in the Rwaished area in the east-central part of the Hammad groundwater basin. The linear trend for all available data is $+18 \mu\text{S}/\text{cm}/\text{yr}$, and the R^2 is 0.48. The data record is long for this well, dating to 1975. However, few measurements are available before 1993. Increases in salinity over time are relatively consistent, although recent samples have somewhat lower EC than samples from the mid-2000’s. Measurements from the mid-2000’s and on exceed the $1500 \mu\text{S}/\text{cm}$ freshwater level in many cases.
